

**McAfee**  
**Anti-Virus Software**  
August, 2001  
**Local In-House SEFSC LAN Users**

It should be obvious to most everyone these days software viruses are becoming more common and more destructive. While IRM runs a firewall and has anti-virus software running on each of the NT servers, these measures will NOT protect your desktop files.

You have the responsibility of updating your anti-virus software periodically. A new virus data definition file comes out each week. I suggest that you upgrade at least one a month. (If you haven't updated in six months you should update and then run the software against ALL of your files.)

To update your McAfee anti-virus software enter (or cut and paste) the following line including quotes **"\\Miantsvr2\apps\Seffc\McAfee Updates\Update.exe"** at the START->RUN dialog box. This will start a wizard to walk you through the two minute upgrade.

While this file exists in other places on our system and can be gotten from the web site, the above procedure is quite simple. You can even create a desktop icon to make it even easier.

If you have problems or questions regarding our NOAA licensed McAfee software please don't hesitate to call me at x278.

Tom Fleming

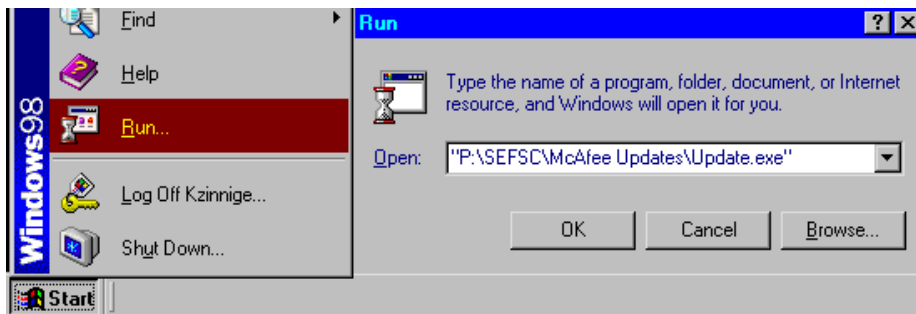

## To update your McAfee Anti-Virus :

### START

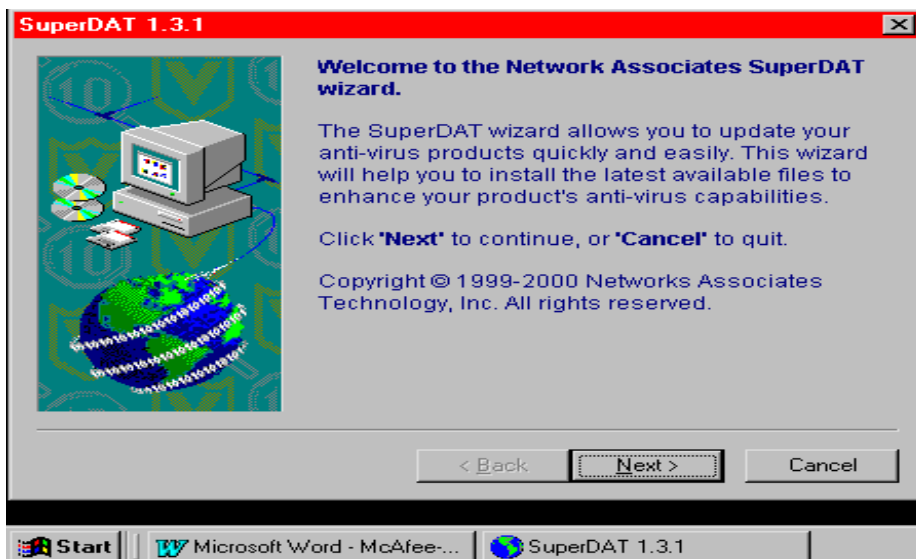

#### RUN

"P:\SEFSC\McAfee Updates\Update.exe" including quotes.

Click: **OK**

This will start a wizard to walk you through the two minute upgrade.

A dialog will walk you through the upgrade process. Follow the instructions displayed.

Several windows will be displayed. If asked any questions, use the defaults and press **Next** to continue.

When the process is complete, the last displayed window will have a "Finish" button.

Click **Finish**
